WO 01/70741 A1

5-ALKYLPYRIDO[2,3-d]PYRIMIDINES TYROSINE KINASE INHIBITORS

FIELD OF THE INVENTION

This invention relates to 5-alkylpyridopyrimidines as inhibitors of cyclin-dependent kinases, particularly cyclin-dependent kinase 4. The compounds of the invention are useful for the treatment of inflammation, cell proliferative diseases such as cancer and restenosis, and neurodegenerative diseases such as Alzheimer's disease.

SUMMARY OF THE RELATED ART

Cyclin-dependent kinases and related serine/threonine protein kinases are cellular enzymes that perform essential functions in regulating cell division and proliferation. The cyclin-dependent kinase catalytic units, of which nine have been identified, are activated by regulatory units known as cyclines. The cyclin-dependent kinases include (Cdk) Cdk1, Cdk2, Cdk4, Cdk5, Cdk6, and Wee-1 kinase. Increased activity or temporally abnormal activation of these kinases results in development of human tumors and other proliferative disorders such as restenosis. Compounds that inhibit Cdks, either by blocking the interaction between a cyclin and its kinase partner, or by binding to and inactivating the kinase, cause inhibition of cell proliferation and thus are useful for treating tumors and other abnormally proliferating cells.

Several compounds that inhibit Cdks have demonstrated both preclinical and clinical anti-tumor activity. For example, flavopiridol is a flavonoid that is a potent inhibitor of Cdk2 and Cdk4, and has been shown to inhibit several types of breast and lung cancer cells (Kaur et al., *J. Natl. Cancer Inst.,* 1992;84:1736-1740; Kaur et al., *Int. J. Oncol.*, 1996;9:1143-1168). In addition, Olomoucine [2-(hydroxyethylamine)-6-benzylamine-9-methylpurine] is a potent inhibitor of Cdk2 and Cdk5 (Vesely et al., *Eur. J. Biochem.*, 1994;224:771-786), and has been shown to inhibit proliferation of approximately 60 different human tumor cell

lines used by the National Cancer Institute (NCI) to screen for new cancer therapies (Abraham et al., *Biol. Cell*, 1995;83:105-120).

In addition to treating cancer, Cdk inhibitors have been shown to treat cardiovascular disorders such as restenosis and atherosclerosis. Other diseases in which Cdk inhibitors are useful include those caused by a variety of infectious agents, including DNA and RNA viruses, and inflammatory disorders such as rheumatoid arthritis.

An object of this invention is to provide a group of small molecular weight organic compounds that are potent Cdk inhibitors, and as such are useful for preventing and treating diseases caused by abnormally proliferating cells.

SUMMARY OF THE INVENTION

This invention provides 5-alkyl pyridopyrimidines that are useful for treating inflammation, cell proliferative diseases such as cancer and restenosis, and neurodegenerative diseases such as Alzheimer's disease. The compounds of the invention display unexpected improvements in pharmacokinetic properties over prior art compounds, including unanticipated metabolic stability and low clearance rates. In addition, the compounds of the invention are unexpectedly selective inhibitors of Cdk4. The compounds of the invention are readily synthesized, and can be administered to patients by a variety of methods.

A preferred form for oral use are capsules, which include the formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component with or without other carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid dosage forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as a mixture of fatty acid glycerides or cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogenous mixture is then poured into convenient size molds, allowed to cool, and thereby to solidify.

Liquid form preparations include solutions, suspensions, and emulsions such as water or water/propylene glycol solutions. For parenteral injection, liquid preparations can be formulated in solution in aqueous polyethylene glycol solution, isotonic saline, 5% aqueous glucose, and the like. Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizing and thickening agents as desired. Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water and mixing with a viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, or other well-known suspending agents.

Also included are solid form preparations that are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like. Waxes, polymers, microparticles, and the like can be utilized to prepare sustained-release dosage forms. Also, osmotic pumps can be employed to deliver the active compound uniformly over a prolonged period.

The pharmaceutical preparations of the invention are preferably in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

The therapeutically effective dose of a compound of Formula I will generally be from about 1 mg/kg to about 100 mg/kg of body weight per day. Typical adult doses will be about 50 mg to about 800 mg per day. The quantity of active component in a unit dose preparation may be varied or adjusted from about 0.1 mg to about 500 mg, preferably about 0.5 mg to 100 mg according to the particular application and the potency of the active component. The composition can, if desired, also contain other compatible therapeutic agents. A subject in need of treatment with a compound of Formula I is administered a dosage of about 1 mg to about 500 mg per day, either singly or in multiple doses over a 24-hour period.

The compounds of the present invention are capable of binding to and inhibiting the activity of proteins having the ability to phosphorylate other proteins, such as cdks, PDGFr, FGFr, c-Src, and EGFr-FL. Cdks form complexes with cyclins, and these complexes phosphorylate key proteins allowing cells to proceed through the cell cycle (Meijer L., *Progress in Cell Cycle Research*, 1995;1:351-363). The compounds of this invention inhibit this phosphorylation

and therefore can be used as anti-proliferative agents for the treatment of cancer and/or restenosis and other proliferative diseases.

Because of their inhibitory activity against cdks and other kinases, the compounds of the present invention are also useful research tools for studying the mechanism of action of those kinases, both in vitro and in vivo.

The examples presented below are intended to illustrate particular embodiments of the invention, and are not intended to limit the scope of the specification or the claims in any way.

An illustration of the preparation of compounds of the present invention is shown in Schemes 1 and 2.

Those having skill in the art will recognize that the starting materials may be varied and additional steps employed to produce compounds encompassed by the present invention, as demonstrated by the following examples.

As shown in Schemes 1 and 2, a 4-substituted amino-2-methansulfanyl-pyrimidine-5-carboxaldehyde is reacted with an organometallic compound, such as, for example, a Grignard reagent, to afford the corresponding secondary alcohol. The alcohol is subsequently oxidized to the ketone. The ketone is then reacted with a trialkyl phosphonoacetate in the presence of base to produce the corresponding 8-substituted-5-alkyl-2-methylsulfanyl-8H-pyrido[2,3-d]pyrimidin-7-one. The pyrido-pyrimidine then can be halogenated at the 6-position with a common halogenating agent, such as, for example, N-bromosucccinimide (NBS). The 2-methylsulfanyl derivative is oxidized to the corresponding methylsulfoxide, which is subsequently treated with a desired aniline to afford the 2-phenylamino invention compound.

When carrying out various reactions to prepare invention compounds, it may be desirable to derivatize reactive groups such as amines, alcohols, and acids, with protecting groups that are readily removed when desired. Such protecting groups simply avoid unwanted side reactions. Use of protecting groups is common in the art of organic chemistry, as described by Greeve and Wuts in *Protective Groups in Organic Synthesis,* John Wiley and Sons, New York (2nd ed, 1991). Typical hydroxy protecting groups include either forming groups such as benzyl, and acyl groups such as tert-butoxycarbonyl(Boc), formyl, and acetyl. Amino protecting groups include benzyl, acyl such as acetyl, and trialkylsilyl groups. Carboxylic acid groups typically are protected by conversion to an ester that can be easily hydrolyzed, for example, trichloroethyl, tert-butyl, benzyl, and the like.

Some of the invention compounds have one or more chiral centers, and thus can exist as individual optical isomers and mixtures thereof. Compound 246 (Table 1), for example, can exist as an RS racemate, or as the individual R or S isomer. All individual isomers and mixtures thereof are included in this invention. Individual isomers are readily prepared by a chiral synthesis, or by conventional resolution techniques well-known to those skilled in the art.

The invention is illustrated further by the following detailed examples which are not to be construed as limiting the invention in scope or spirit to the specific procedures described in them. The starting materials and various intermediates utilized in the synthesis of invention compounds may be obtained from commercial sources, prepared from commercially available organic compounds, or prepared using well-known synthetic methods. The disclosures in this application of all articles and references, including patents, are incorporated herein by reference.

To a suspension of hexane rinsed 60% sodium hydride (0.83 g), in dimethylformamide (5 mL) at 0°C, was added a solution of 3-mercapto-1,2,4-triazole (2.0 g) in dimethylformamide (10 mL) in portions. After 45 minutes 4-nitrophenethyl bromide (4.1 g) was added, and the reaction mixture was stirred at room temperature for 18 hours. 1 M Hydrochloric acid (70 mL) was added and the aqueous phase was extracted with diethyl ether (3 × 100 mL), and the combined organic extracts were concentrated to dryness. The resulting solid was collected, washed with diethyl ether (2 × 10 mL) and dried to yield the nitrobenzene intermediate (3.17 g). *MS*: MH+, 251; MH- 248.9. A solution of this intermediate (1.0 g) was reduced using Raney Nickel (0.5 g) and hydrogen in THF (100 mL). The sample was concentrated to dryness to yield the title compound (0.88 g), *MS*: MH+, 221; MH-, 219.

8-Cyclopentyl-5-methyl-2-{4-[2-(4H-[1,2,4]triazol-3-ylsulfanyl)-ethyl]-phenylamino}-8H-pyrido[2,3-d]pyrimidin-7-one. A solution of 8-cyclopentyl-5-methyl-2-methanesulfinyl-8*H*-pyrido[2,3-*d*]pyrimidin-7-one (0.02 g), 4-[2(4*H*-

[1,2,4]triazol-3-ylsulfanyl)-ethyl]-phenylamine (0.0166 g) and trifluoroacetic acid (0.06 mL) in acetonitrile (2 mL) was heated at 80°C for 18 hours. The reaction mixture was cooled and the solvent removed in vacuo. 1 M Sodium hydroxide (4 mL) was added and the aqueous phase was extracted with diethyl ether (3 × 4 mL); sodium chloride (20 mg) was added after the first extraction. 8-Cyclopentyl-5-methyl-2-[4-(1H-[1,2,4]triazol-3-ylsulfanyl)-phenylamino]-8H-pyrido[2,3-d]pyrimidin-7-one **(Compound 223)**

4-(1H-[1,2,4]triazol-3-ylsulfanyl)-phenylamine. To a suspension of hexanes rinsed 60% sodium hydride (1.16 g) in dimethylformamide (10 mL) at 0°C was added a solution of 3-mercapto-1,2,4-triazole (4.0 g) in dimethylformamide (20 mL) dropwise. After 20 minutes, 1-fluoro-4-nitrobenzene (5 g) in dimethylformamide (20 mL) was added, and the reaction mixture was stirred at room temperature for 2 hours, then at 60°C for 18 hours. 1 M Hydrochloric acid (100 mL) was added, and the solid was collected and dried. A second crop of solid (2.1 g) was recovered by crystallization from the mother

liquors. To the combined solids was added dichloromethane (300 mL) and 1 M sodium hydroxide (200 mL). The dichloromethane was further extracted with 1 M sodium hydroxide (100 mL). The combined aqueous phases were extracted with dichloromethane (2 × 300 mL) then acidified to pH = 1. The solid formed was collected and dried to yield the nitrobenzene derivative (1.96 g). This product was reduced using Raney Nickel and hydrogen in tetrahydrofuran (100 mL). Following removal of the catalyst, the sample was concentrated to dryness to yield the desired product (1.7 g), *MS*: MH+, 192.9; MH-, 190.0.

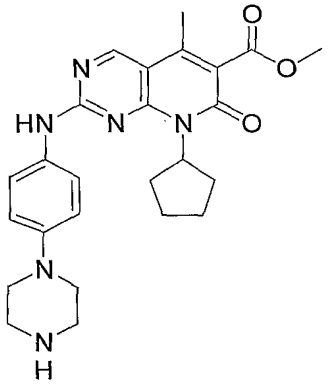
8-Cyclopentyl-5-methyl-7-oxo-2-(4-piperazin-1-yl-phenylamino)-7,8-dihydro-pyrido[2,3-d]pyrimidine-6-carboxylic acid methyl ester **(Compound 224)**



4-[4-(6-Bromo-8-cyclopentyl-5-methyl-7-oxo-7,8-dihydro-pyrido[2,3-*d*]pyrimidin-2-ylamino)-phenyl]-piperazine-1-carboxylic acid *tert*-butyl ester (300 mg, 0.515 mmol), $Pd(OAc)_2$ (23 mg, 0.05 mmol), 1,2-bis(diphenylphosphino)-propane 64 mg, 0.155 mmol), and triethylamine (0.18 mL, 1.29 mmol) were combined in methanol and pressurized to 500 PSI in

CO gas. The reaction mixture was heated to 100°C and stirred for 14 hours, then allowed to cool to 24°C. EXAMPLE 19

Biological Assays

Several of the invention compounds have been evaluated in standard assays routinely used to measure inhibition of cyclin-dependent kinase enzymes and other serine/threonine protein kinases. The assays were carried out as follows:

Cdk1 and Cdk2 enzyme assays for IC_{50} determinations and kinetic evaluation are performed as follows. 96-well filter plates (Millipore

MADVN6550) are used. The total volume is 0.1 mL 20 mM TRIS (pH 7.4), 50 mM NaCl, 1 mM dithiothreitol, 10 mM $MgCl_2$, 12 mM ATP containing 0.25 μCi [^{32}P]ATP, 20 ng enzyme (Cdk2/cyclin E, Cdk2/cyclin A, or Cdk1/cyclin B), 1 μg retinoblastoma protein, and appropriate dilutions of the particular invention compound. All components except the ATP are added to the wells, and the plate is placed on a plate mixer for 2 minutes. The reaction is initiated by addition of [^{32}P]ATP, and the plate is incubated at 25°C for 15 minutes. The reaction is terminated by addition of 0.1 mL 20% TCA. The plate is kept at 4°C for at least 1 hour to allow the substrate to precipitate. The wells are then washed five times with 0.2 mL 10% TCA, and ^{32}P incorporation is determined with a beta plate counter (Wallac Inc., Gaithersburg, MD).

The Cdk4 enzyme assay for IC_{50} determination and kinetic evaluation is performed as follows. 96-well filter plates (Millipore MADVN6550) are used. The total volume is 0.1 mL containing a final concentration of 20 mM TRIS (tris[hydroxymethyl]aminomethane) (pH 7.4), 50 mM NaCl, 1 mM dithiothreitol, 10 mM $MgCl_2$, 25 μM ATP containing 0.25 μCi [^{32}P]ATP, 20 ng Cdk4, 1 μg retinoblastoma protein, and appropriate dilutions of a compound of the present invention. All components except the ATP are added to the wells, and the plate is placed on a plate mixer for 2 minutes. The reaction is started by adding [^{32}P]ATP, and the plate is incubated at 25°C for 15 minutes. The reaction is terminated by addition of 0.1 mL 20% trichloroacetic acid (TCA). The plate is kept at 4°C for at least 1 hour to allow the substrate to precipitate. The wells are then washed five times with 0.2 mL 10% TCA, and ^{32}P incorporation is determined with a beta plate counter (Wallac Inc., Gaithersburg, MD).

For PDGF receptor (PDGFr) and FGF receptor (FGFr) tyrosine kinase assays, full-length cDNAs for the mouse PDGF-β and human FGF1(flg) receptor tyrosine kinases are obtained from J. Escobedo and prepared as described previously (Escobedo et al., *J. Biol. Chem.*, 1988;262:1482-1487). PCR primers are designed to amplify a fragment of DNA that codes for the intracellular tyrosine kinase domain. The fragment is inserted into a baculovirus vector, cotransfected with AcMNPV DNA, and the recombinant virus is isolated. SF9

insect cells are infected with the virus to overexpress the protein, and the cell lysate is used for the assay.

PDGFr and FGFr enzyme assays are performed in 96-well plates (100 μL/incubation/well), and conditions are optimized to measure the incorporation of ^{32}P from [$\gamma^{32}P$]ATP into a glutamate-tyrosine co-polymer substrate. Briefly, to each well is added 82.5 μL incubation buffer containing 25 mM Hepes (pH 7.0), 150 mM NaCl, 0.1% Triton X-100, 0.2 mM PMSF, 0.2 mM Na_3VO_4, 10 mM $MnCl_2$, and 750 μg/mL Poly (4:1) glutamate-tyrosine followed by 2.5 μL inhibitor and 5 μL enzyme lysate (7.5 μg/μL FGFr or 6.0 μg/μL PDGFr) to initiate the reaction. Following a 10-minute incubation at 25°C, 10 mL [$\gamma^{32}P$]ATP (0.4 μCi plus 50 μM ATP) is added to each well, and samples are incubated for an additional 10 minutes at 25°C. The reaction is terminated by the addition of 100 μL 30% trichloroacetic acid (TCA) containing 20 mM sodium pyrophosphate and precipitation of material onto glass fiber mats (Wallac). Filters are washed three times with 15% TCA containing 100 mM sodium pyrophosphate, and the radioactivity retained on the filters is counted in a Wallac 1250 Betaplate reader. Nonspecific activity is defined as radioactivity retained on the filters following incubation of samples with buffer alone (no enzyme). Specific enzymatic activity (enzyme plus buffer) is defined as total activity minus nonspecific activity. The concentration of a compound that inhibited specific activity by 50% (IC_{50}) is determined based on the inhibition curve.

The c-Src protein kinase assay is carried out as follows. c-Src kinase is purified from baculovirus infected insect cell lysates using an antipeptide monoclonal antibody directed against the N-terminal amino acids (amino acids 2-17) of c-Src. The antibody, covalently linked to 0.65 μm latex beads, is added to a suspension of insect cell lysis buffer comprised of 150 mM NaCl, 50 mM Tris (pH 7.5), 1 mM DTT, 1% NP-40, 2 mM EGTA, 1 mM sodium vanadate, 1 mM PMSF, 1 μg/mL each of leupeptin, pepstatin, and aprotinin. Insect cell lysate containing c-Src protein is incubated with these beads for 3 to 4 hours at 4°C with rotation. At the end of the lysate incubation, the beads are rinsed three times in

lysis buffer, resuspended in lysis buffer containing 10% glycerol, and frozen. These latex beads are thawed, rinsed three times in assay buffer (40 mM Tris (pH 7.5), 5 mM μg Cl_2) and suspended in the same buffer. In a Millipore 96-well plate with a 0.65 μm polyvinylidine membrane bottom are added the reaction components: 10 μL c-Src beads, 10 μL 2.5 mg/mL poly GluTyr substrate, 5 μM ATP containing 0.2 μCi [^{32}P]ATP, 5 μL DMSO containing inhibitors or as a solvent control, and buffer to make the final volume 125 μL. The reaction is started at room temperature by addition of ATP and quenched 10 minutes later by the addition of 125 μL 30% TCA, 0.1 M sodium pyrophosphate for 5 minutes on ice. The plate is then filtered and the wells washed with two 250-mL aliquots of 15% TCA, 0.1 M pyrophosphate. The filters are then punched, counted in a liquid scintillation counter, and the data examined for inhibitory activity in comparison to a known inhibitor such as erbstatin. The method has been described by Thompson et al., *J. Med. Chem.*, 1994;37:598-609.

The results of the foregoing assays for several representative invention compounds are presented in Table 1. The metabolic stability of representative Compounds was evaluated in human liver microsomes (HLM) and is given in Table 1 as the time in minutes (T Half) required for one-half of the parent compound to disappear after being added to a HLM homogluate.

Various properties of preferred 5-methylpyridopyrimidin-7-ones such as 8-cyclopentyl-5-methyl-2-[(4-piperazinylphenyl)-amino]-8-hydropyridino[2,3-d]pyrimidin-7-one (**Compound 1**), including IC_{50}, stability, and clearance rate, are displayed in Table 2.

From the results displayed in Table 2, it is clear that Compound 1 and other invention compounds specifically inhibit Cdk4, and has relatively little effect on Cdk1 and Cdk2. Furthermore, Compound 1 is relatively more stable, and cleared at a slower rate, compared to prior art compounds. These results indicate that the methyl group in the 5-position confers unique properties onto the pyridopyrimidine and is a preferred embodiment.

Formulation Examples

As noted above, the invention compounds will typically be formulated with common excipients, diluents, and carriers to provide compositions that are well-suited for convenient administration to mammals. The following examples illustrate typical compositions that are provided in a further embodiment of this invention.

EXAMPLE 20

Tablet Formulation

Ingredient	Amount
Compound 12	50 mg
Lactose	80 mg
Cornstarch (for mix)	10 mg
Cornstarch (for paste)	8 mg
Magnesium Stearate (1%)	2 mg
	150 mg

Compound 12 is mixed with the lactose and cornstarch (for mix) and blended to uniformity to a powder. The cornstarch (for paste) is suspended in 6 mL of water and heated with stirring to form a paste. The paste is added to the mixed powder, and the mixture is granulated. The wet granules are passed through a No. 8 hard screen and dried at 50°C. The mixture is lubricated with 1% magnesium stearate and compressed into a tablet. The tablets are administered to a patient at the rate of 1 to 4 each day for prevention and treatment of atherosclerosis.

EXAMPLE 21

Parenteral Solution

In a solution of 700 mL of propylene glycol and 200 mL of water for injection is added 20.0 g of Compound 38. The mixture is stirred and the pH is adjusted to 5.5 with hydrochloric acid. The volume is adjusted to 1000 mL with water for injection. The solution is sterilized, filled into 5.0 mL ampoules, each containing 2.0 mL (40 mg of Compound 38), and sealed under nitrogen. The solution is administered by injection to a patient suffering from cancer and in need of treatment.

The invention and the manner and process of making and using it, are now described in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, to make and use the same. It is to be understood that the foregoing describes preferred embodiments of the present

invention and that modifications may be made therein without departing from the spirit or scope of the present invention as set forth in the claims. To particularly point out and distinctly claim the subject matter regarded as invention, the following claims conclude this specification.
